This document describes CUFFT, the NVIDIA® CUDA™ (compute unified device architecture) Fast Fourier Transform (FFT) library. The FFT is a divide-and-conquer algorithm for efficiently computing discrete Fourier transforms of complex or real-valued data sets, and it is one of the most important and widely used numerical algorithms, with applications that include computational physics and general signal processing. The CUFFT library provides a simple interface for computing parallel FFTs on an NVIDIA GPU, which allows users to leverage the floating-point power and parallelism of the GPU without having to develop a custom, GPU-based FFT implementation.

FFT libraries typically vary in terms of supported transform sizes and data types. For example, some libraries only implement Radix-2 FFTs, restricting the transform size to a power of two, while other implementations support arbitrary transform sizes. This version of the CUFFT library supports the following features:

- 1D, 2D, and 3D transforms of complex-valued signal data.
- Batch execution for doing multiple 1D transforms in parallel.
- Transform sizes (in any dimension) in the range $[2, 16384]$.

**CUFFT Types and Definitions**

There are three CUFFT types, as well as transform direction definitions:

- “Type cufftHandle” on page 2
- “Type cufftResult” on page 2
- “Type cufftComplex” on page 2
- “CUFFT Transform Directions” on page 2
Type `cufftHandle`

typedef unsigned int cufftHandle;

is a handle type used to store and access CUFFT plans. For example, the user receives a handle after creating a CUFFT plan and uses this handle to execute the plan.

Type `cufftResult`

typedef unsigned int cufftResult;

is used exclusively for API function return values. The possible return values are defined as follows:

<table>
<thead>
<tr>
<th>Return Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUFFT_SUCCESS</td>
</tr>
<tr>
<td>CUFFT_INVALID_PLAN</td>
</tr>
<tr>
<td>CUFFT_ALLOC_FAILED</td>
</tr>
<tr>
<td>CUFFT_INVALID_TYPE</td>
</tr>
<tr>
<td>CUFFT_INVALID_VALUE</td>
</tr>
<tr>
<td>CUFFT_INTERNAL_ERROR</td>
</tr>
<tr>
<td>CUFFT_EXEC_FAILED</td>
</tr>
<tr>
<td>CUFFT_SETUP_FAILED</td>
</tr>
<tr>
<td>CUFFT_SHUTDOWN_FAILED</td>
</tr>
<tr>
<td>CUFFT_INVALID_SIZE</td>
</tr>
</tbody>
</table>

Type `cufftComplex`

typedef float cufftComplex[2];

is a single-precision, floating-point complex data type that consists of interleaved real and imaginary components.

**CUFFT Transform Directions**

The CUFFT library defines forward and inverse Fast Fourier Transforms according to the sign of the complex exponential term:

```c
#define CUFFT_FORWARD -1
#define CUFFT_INVERSE 1
```
For higher-dimensional transforms (2D and 3D), CUFFT performs FFTs in row-major or C order. For example, if the user requests a 3D transform plan for sizes X, Y, and Z, CUFFT transforms along Z, Y, and then X. The user can configure column-major FFTs by simply changing the order of size parameters to the plan creation API functions.

### CUFFT API Functions

The CUFFT API is modeled after FFTW (see [http://www.fftw.org](http://www.fftw.org)), which is one of the most popular and efficient CPU-based FFT libraries. FFTW provides a simple configuration mechanism called a *plan* that completely specifies the optimal—that is, the minimum floating-point operation (flop) — plan of execution for a particular FFT size and data type. The advantage of this approach is that once the user creates a plan, the library stores whatever state is needed to execute the plan multiple times without recalculation of the configuration. The FFTW model works well for CUFFT because different kinds of FFTs require different thread configurations and GPU resources, and plans are a simple way to store and reuse configurations.

The CUFFT library initializes internal data upon the first invocation of an API function. Therefore, all API functions could possibly return the `CUFFT_SETUP_FAILED` error code if the library fails to initialize. CUFFT shuts down automatically when all user-created FFT plans are destroyed.

The CUFFT functions are as follows:

- “Function cufftPlan1d()” on page 4
- “Function cufftPlan2d()” on page 4
- “Function cufftPlan3d()” on page 5
- “Function cufftDestroy()” on page 6
- “Function cufftExecute()” on page 6
Function cufftPlan1d()

cufftResult
cufftPlan1d( cufftHandle *plan, int nx, int type, int batch );

creates a 1D FFT plan configuration for a specified signal size and data type. The batch input parameter tells CUFFT how many 1D transforms to configure.

Input

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Pointer to a cufftHandle object</td>
</tr>
<tr>
<td>nx</td>
<td>The transform size (e.g., 256 for a 256-point FFT)</td>
</tr>
<tr>
<td>type</td>
<td>The transform data type (e.g., CUFFT_DATA_C2C for complex)</td>
</tr>
<tr>
<td>batch</td>
<td>Number of transforms of size nx</td>
</tr>
</tbody>
</table>

Output

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Contains a CUFFT 1D plan handle value</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUFFT_SETUP_FAILED</td>
<td>CUFFT library failed to initialize.</td>
</tr>
<tr>
<td>CUFFT_INVALID_SIZE</td>
<td>The nx parameter is not a supported size.</td>
</tr>
<tr>
<td>CUFFT_INVALID_TYPE</td>
<td>The type parameter is not supported.</td>
</tr>
<tr>
<td>CUFFT_ALLOC_FAILED</td>
<td>Allocation of GPU resources for the plan failed.</td>
</tr>
<tr>
<td>CUFFT_SUCCESS</td>
<td>CUFFT successfully created the FFT plan.</td>
</tr>
</tbody>
</table>

Function cufftPlan2d()

cufftResult
cufftPlan2d( cufftHandle *plan, int nx, int ny, int type );

creates a 2D FFT plan configuration according to specified signal sizes and data type. This function is the same as cufftPlan1d() except that it takes a second size parameter, ny, and does not support batching.

Input

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Pointer to a cufftHandle object</td>
</tr>
<tr>
<td>nx</td>
<td>The transform size in the X dimension</td>
</tr>
<tr>
<td>ny</td>
<td>The transform size in the Y dimension</td>
</tr>
<tr>
<td>type</td>
<td>The transform data type (e.g., CUFFT_DATA_C2C for complex)</td>
</tr>
</tbody>
</table>
Function cufftPlan3d()

cufftResult

cufftPlan3d( cufftHandle *plan, int nx, int ny, int nz,
    int type );

creates a 3D FFT plan configuration according to specified signal sizes and data type. This function is the same as cufftPlan2d() except that it takes a third size parameter nz.

Input

plan  Pointer to a cufftHandle object
nx    The transform size in the X dimension
ny    The transform size in the Y dimension
nz    The transform size in the Z dimension
type  The transform data type (e.g., CUFFT_DATA_C2C for complex)

Output

plan  Contains a CUFFT 3D plan handle value

Return Values

CUFFT_SETUP_FAILED  CUFFT library failed to initialize.
CUFFT_INVALID_SIZE  The nx or ny parameter is not a supported size.
CUFFT_INVALID_TYPE  The type parameter is not supported.
CUFFT_ALLOC_FAILED  Allocation of GPU resources for the plan failed.
CUFFT_SUCCESS      CUFFT successfully created the FFT plan.
Function `cufftDestroy()`

```c
        cufftResult
cufftDestroy( cufftHandle plan );
```

frees all GPU resources associated with a CUFFT plan and destroys the internal plan data structure. This function should be called once a plan is no longer needed to avoid wasting GPU memory.

**Input**

- `plan`  The `cufftHandle` object of the plan to be destroyed.

**Return Values**

- `CUFFT_SETUP_FAILED`  CUFFT library failed to initialize.
- `CUFFT_SHUTDOWN_FAILED`  CUFFT library failed to shutdown.
- `CUFFT_INVALID_PLAN`  The plan parameter is not a valid handle.
- `CUFFT_SUCCESS`  CUFFT successfully destroyed the FFT plan.

Function `cufftExecute()`

```c
        cufftResult
cufftExecute( cufftHandle plan, void *idata, void *odata,
                        int sign );
```

executes a CUFFT transform plan. CUFFT uses as input data the GPU memory pointed to by the `idata` parameter. This function stores the Fourier coefficients in the `odata` array. If `idata` and `odata` are the same, this method does an in-place transform.

**Input**

- `plan`  The `cufftHandle` object for the plan to update
- `idata`  Pointer to the input data (in GPU memory) to transform
- `odata`  Pointer to the output data (in GPU memory)
- `sign`  The transform direction: `CUFFT_FORWARD` or `CUFFT_INVERSE`

**Output**

- `odata`  Contains the Fourier coefficients

**Return Values**

- `CUFFT_SETUP_FAILED`  CUFFT library failed to initialize.
- `CUFFT_INVALID_PLAN`  The plan parameter is not a valid handle.
CUFFT Code Examples

This section provides simple examples of 1D, 2D, and 3D complex transforms that use the CUFFT to perform forward and inverse FFTs. In the examples, pointers are assumed to point to signal data previously allocated on the GPU.

1D Complex Transforms

```c
#define NX 256
#define BATCH 10

cufftComplex *data;
cudaMalloc((void**)&data, sizeof(cufftComplex)*NX*BATCH);

/* Create a 1D FFT plan. */
cufftPlan1d(&plan, NX, CUFFT_DATA_C2C, BATCH);

/* Use the CUFFT plan to transform the signal in place. */
cufftExecute(plan, data, data, CUFFT_FORWARD);

/* Inverse transform the signal in place. */
cufftExecute(plan, data, data, CUFFT_INVERSE);

/* Destroy the CUFFT plan. */
cufftDestroy(plan);
cudaFree(data);
```

---

### Return Values (continued)

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUFFT_INVALID_VALUE</td>
<td>The data and/or sign parameter is not valid.</td>
</tr>
<tr>
<td>CUFFT_EXEC_FAILED</td>
<td>CUFFT failed to execute the transform on GPU.</td>
</tr>
<tr>
<td>CUFFT_SUCCESS</td>
<td>CUFFT successfully executed the FFT plan.</td>
</tr>
</tbody>
</table>
2D Complex Transforms

```c
#define NX 200
#define NY 100

cufftHandle plan;
cufftComplex *data1, *data2;
cudaMalloc((void**)&data1, sizeof(cufftComplex)*NX*NY);
cudaMalloc((void**)&data2, sizeof(cufftComplex)*NX*NY);

/* Create a 2D FFT plan. */
cufftPlan2d(&plan, NX, NY, CUFFT_DATA_C2C);

/* Use the CUFFT plan to transform the signal out of place. */
cufftExecute(plan, data1, data2, CUFFT_FORWARD);

/* Inverse transform the signal in place */
cufftExecute(plan, data2, data2, CUFFT_INVERSE);

/* Destroy the CUFFT plan. */
cufftDestroy(plan);
cudaFree(data1); cudaFree(data2);
```

3D Complex Transforms

```c
#define NX 64
#define NY 80
#define NZ 128

cufftHandle plan;
cufftComplex *data1, *data2;
cudaMalloc((void**)&data1, sizeof(cufftComplex)*NX*NY*NZ);
cudaMalloc((void**)&data2, sizeof(cufftComplex)*NX*NY*NZ);
```
/* Create a 3D FFT plan. */
cufftPlan3d(&plan, NX, NY, NZ, CUFFT_DATA_C2C);

/* Transform the first signal in place. */
cufftExecute(plan, data1, data1, CUFFT_FORWARD);

/* Transform the second signal using the same plan. */
cufftExecute(plan, data2, data2, CUFFT_FORWARD);

/* Destroy the CUFFT plan. */
cufftDestroy(plan);
cudaFree(data1); cudaFree(data2);
